Business Case

Streamlining Banking Support Operations | XYZ Investment Bank

1. Background

XYZ Investment Bank supports more than 120 applications. The bank is moving from an offshore-only support model to a mixed-shore model, with teams working across locations.

2. Business Problem

Support procedures and knowledge are scattered or undocumented. Application ownership and escalation routes are not always clear, making support work harder to coordinate and manage.

3. Business Need

The bank needs a more consistent and visible way to manage application support, share knowledge, clarify responsibilities, and coordinate teams across locations.

4. Goal

To improve banking application support by establishing a structured mixed-shore operating model, standardising support processes, improving documentation and ownership, and increasing operational visibility and efficiency.

5. Objective

- Establish a structured mixed-shore support model with clear application ownership.
- Standardize support processes and documentation to improve consistency.
- Improve operational visibility and efficiency through better tracking and escalation management.

6. Options to Consider

- Option 1: Continue with the current approach.
- Option 2: Improve existing procedures and responsibilities without introducing a central platform.
- Option 3: Establish a centralized support operations capability, supported by clear processes and appropriate technology.

7. Preliminary Recommendation

Explore Option 3 further, while assessing whether existing tools can support the required changes. The final solution should be confirmed after business analysis and requirements gathering.

8. Expected Benefits

Clearer application ownership; easier access to support knowledge; more consistent support and escalation processes; improved visibility of support activity across locations.

9. Key Risks and Considerations

Incomplete documentation, limited knowledge transfer, unclear responsibilities, access or connectivity issues, and resistance to new ways of working may affect the transition.

10. Decision Requested

Approve the next stage of business analysis to understand stakeholder needs, document current support processes, identify root causes, and define business and solution requirements before confirming the final solution.

Note: This is an initial business case. Detailed stakeholder requirements, user stories, workflows, and wireframes will be developed during subsequent analysis and design.
